Structure 6:661-672 (1998).

-!-FUNCTURE 6:661-672 (1998).

-!-SUBLORY: Forms a tight complex with Experiment of genes for sterol biosynthesis and the LDL receptor gene.

-!-SUBLORY: Forms a tight complex with SGAP in the Ex membrane.

Efficient DNA binding of the soluble transcription factor fragment requires dimerization with another bHLH protein.

-!-SUBCEDIULIAR LOCATION: Integral membrane protein that moves from the endoplasmic reticulum to the Golgi in the absence of sterols.
                                                                                                                                                                                                                                                                                                                                         MEDLINE=98298442; PubMed=9634703;

PTM: Under sterol-depleted conditions, SREBPs are cleaved sequentially by site-1 and site-2 protease. The first oleavage occurs within the luminal loop and is directly regulated by sterols. The second cleavage by site-2 protease occurs within the first transmembrane stretch and liberates the soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                transcription factor. Cleavage by the cysteine proteases, caspase-3 and caspase-7, is induced during apoptosis, independent of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isoid=P36956-3; Sequence=VSP 002149, VSP 002150;
TISSUE SPECIFICITY: Expressed in a wide variety of tissues, most abundant in liver and adrenal gland. In fetal tissues lung and liver shows highest expression. Isoform SREBP-1C predominates in liver, adrenal gland and ovary, whereas SREBP-1A predominates in hepatoma cell lines. Both isoforms are found in kidney, brain,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sterol levels. MISCELLANBOUS: SREBPS have to be in a complex with the cleavage-activating protein (SCAP) to move to the Golgi and be cleaved by

"bual DNA binding specificity of ADDI/SREBPI controlled by a single
amino acid in the beasto helix-loop-helix domain.";

MOI. Cell. Biol. 15:3582-5588 (1955).

"PUNCTION: Transcriptional activator that binds to the sterol
regulatory element 1 (5RE-1) (5'-ATCACCCCAC-3'). Has dual sequence
specificity, binding to both an B-box motif (5'-ATCACCTGA-3') and

to SRE-1 (5'-ATCACCCAC-3'). Regulates the transcription of genes
for sterol biosynthesis and the LDI receptor gene.

STETICIENT DNA binding of the soluble transcription factor fragment
requires dimerization with another bHLM procein.

-!- SUBCELDUAR LOCATION: Integral membrane procein that moves from
the endoplasmic reticulum to the Golgi in the absence of sterols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               FIGURE 1 The first cleaved sequentially by site-1 and site-2 protease. The first cleavage sequentially by site-1 and site-2 protease. The first cleavage occurs within the luminal loop and is directly regulated by sterols. The second cleavage by site-2 protease occurs within the first transmembrane stretch and liberates the soluble first transmiption fearor. Cleavage by the cystaine proteases, caspase-3 and caspase-7, is induced during apoptosis, independent of sterol levels (By similarity).

MISCELLANGOUS: SREBPS have to be in a complex with the cleavage-activating protein (SCAP) to move to the Golgi and be cleaved by site-1 protease.
                                                                                                                                                                                                                                                                                                                                              Rattus norvegicus (Rat).

                                                   Transcriptional activation domains of sterol regulatory element.

It transcriptional activation domains of sterol regulatory element.

It transcriptional activation domains of sterol regulatory element.

It diding procein-1 (SREB-1) ";

I. J. Biol. Chem. 269:17267-17273 (1994).

I. FUNCTION: Transcriptional activator that binds to the sterol regulatory element 1 (SRE-1) (5'-ATCACCCCAC-3'). Has dual sequence specificity, binding to both an E-box motif (5'-ATCACCTGA-3') and to SRE-1 (5'-ATCACCCCAC-3'). Regulates the transcription of genes for sterol biosynthesis and the IDL receptor gene.

I. SUBCLIDIAN binding of the soluble transcription factor fragment requires dimerization with another bHLH protein.

I. SUBCLIDIAN LOCATION: Integral membrane protein that moves from the endoplasmic reticulum to the Golgi in the absence of sterols.

I. PTM: Under sterol-depleted conditions, SREBPs are cleaved sequentially by site-1 and site-2 protease. The first cleavage occurs within the luminal loop and is directly regulated by sterols. The second cleavage by site-2 protease occurs within the transcription farrance of stretch and liberates the sculuble properse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          transcription factor. Cleavage by the cysteine proteases, caspase-3 and caspase-7, is induced during apoptosis, independent of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sterol levels.

-!- MISCELLANBOUS: SREBPs have to be in a complex with the cleavage-activating protein (SCAP) to move to the Golgi and be cleaved by site-1 protease.
-!- SIMILARITY: Contains 1 basic helix-loop-helix (bHLH) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Helix-loop-helix motif (By similarity)

TISSUE SPECIFICITY: Isoform SREBP-1C predominates in liver,
adrenal gland, brain and adipose tissue, whereas isoform SREBP-1A
predominates in splean. Both isoforms are found in kidney, thymus,
testis, muscle, jejunum, and ileum.
PTM: Under sterol-depleted conditions, SREBPs are cleaved
sequentially by site-1 and site-2 protease. The first cleavage
occurs within the luminal loop and is directly regulated by
sterols. The second cleavage by site-2 protease occurs within the
first transmembrane stretch and liberates the soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               transcription factor. Cleavage by the cysteine proteases, caspase-3 and caspase-7, is induced during apoptosis, independent of

MISCELIAMBOUS: SREBPs have to be in a complex with the cleavage-activating protein (SCAP) to move to the Golgi and be cleaved by site-1 protease.

SIMILARITY: Contains 1 basic helix-loop-helix (bHLH) domain.
                                                                                                                                                                                       Shimomura I., Shimano H., Horton J.D., Goldstein J.L., Brown M.S., "Differential expression of exons la and lc in mRNAs for sterol regulatory element binding protein-1 in human and mouse organs and cultured cells.",

yesuence 4, Application US/09382911

Patent No. 622168

GENERAL INFORMATION:
APPLICANT: Prescott, Steven M.
APPLICANT: Bunting, Michaeline
APPLICANT: Topham, Matthew
TITLE OF INVENTION: Diacylglycerol Kinase Isoforms Epsilon and Zeta and
TITLE OF INVENTION: Methods of Use Thereof
TITLE OF INVENTION: Methods of Use Thereof
TITLE OF PLACATION NUMBER: US/09/382,911
CURRENT APPLICATION NUMBER: US/09/382,911
CURRENT FILING DATE: 1999-06-25
PRIOR FILING DATE: 1997-04-22

PRIOR FILING DATE: 1997-04-22

PRIOR APPLICATION NUMBER: 60/016,210
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
